boundary surfaces is exposed at least partially by illumination light (IL); b) fluid source (13a) that has a fluid connection to the chamber via a fluid supply line (19); and c) control device (18) for the pressure of the liquid filling; wherein the at least one enclosed chamber is configured in such a way that a change in the fluid pressure inside the at least one chamber results in a change in non-rotational-symmetric imaging properties (astigmatic) of the optical element that have an n-fold symmetry relative to the optical axis of the optical element, where n is greater than 1.
